

5 reasons why governments choose Language Weaver

Explore why governments and intelligence agencies choose enterprise-grade machine translation.

1

Faster multilingual content analysis and investigation

Language Weaver's scalability enables government and intelligence agencies to work more efficiently, speeding up analysis, investigations, and responses.

Translate over a million documents and terabytes of content at up to 100,000 words per minute across 3,500+ language combinations. Automatic language identification allows users to upload text-based content individually, in bulk, or zipped, and Language Weaver handles the rest.

2

Protection of sensitive government data

Our self-hosted on-premise solution **Language Weaver Edge** ensures complete data security and compliance by keeping sensitive content within your controlled infrastructure, protected from unauthorized access with role-based access control.

It can be deployed on physical hardware, virtual machines, or encapsulated within containers, and can operate in a completely isolated environment if needed, enhancing security. Alternatively, Language Weaver offers a private cloud solution that adapts to multiple enterprise security requirements.

Document watermarking

Language Weaver also offers full page document watermarking enabling an extra layer of protection against unauthorised use for documentation being translated by large volumes of users.

3

Multiple diverse file types

With Language Weaver you can seamlessly translate a range of file types including text, images and audio content.

In Language Weaver Edge on-premise you can use automatic speech recognition (ASR) module to seamlessly transcribe and translate audio and video files. Additionally, Language Weaver offers an integration with **Revoiceit**, an AI dubbing and production platform, to enable smooth and reliable translation workflows.

4

Maximum connectivity

Language Weaver can integrate with legal case management platforms such as Relativity or digital forensic tools like NUIX to automatically translate multilingual content within the platform.

The platform also supports out-of-the-box connectivity with popular chatbot applications and browsers, ServiceNow, Microsoft Office, and more. You can also use the Language Weaver API framework to integrate secure MT into any other system you use.

Connect your CAT tool

Integrate Language Weaver with your translation technology tool of choice, such as Trados. When integrated, you can leverage machine translation to translate your files and optionally add an expert-in-the-loop as required to review translation output.

5

Ultimate control with adaptive and custom MT

With Language Weaver's advanced adaptability, you can use your own terminology lists to generate translation output that is tailored to your specific domain or train the AI with your own data all without any outside involvement.

Combine the power of direct user feedback, approval workflows and auto-adaptive capabilities to continuously enhance the performance of the solution for your needs.

Automatic post-editing

With Language Weaver's Generative Language Pairs, machine translation and Generative AI, through LLMs, are combined to automate more of the machine translation post-editing steps, minimizing the amount of manual work needed, and offering a continuous auto adaptive improvement and a seamless process where time-to-insight is crucial.

Ready to break down language barriers?

Our team of machine translation experts are here to understand your challenges, answer your questions, and help you with your multilingual content demands.
